What is the Bioinspired Exosuit?

The Bioinspired Exosuit...

- Continues a multi-year effort.
- Utilizes Hydro Muscles, which are pneumatically-actuated artificial muscle.
- Uses neural network-based control informed by sensors.
- Adapts to the user's specific gait cycle to provide optimal support.
- Lowers the user's heart rate by providing assistive forces while walking over various speeds.

Hydro Muscle

- Pressurized to expand
- Depressurized to generate force

- Degree sensitive
- Discrete
- Continuous

CRFC Valve

(Compact Robotic Flow Control Valve)

Mechanical Designs

←Backboard Design

Motor/Sensor Suite

Servo Motor

Orientation Sensor
(9-Axis IMU)

Force Variable
Resistor

Load Cell

High-Level Electronics Architecture

Exosuit Control System

Legend:

- Inter-Integrated Circuit (I2C)
- Asynchronous Serial (UART)
- Analog Voltage
- Pulse Width Modulation (PWM)

Orientation Sensor (9-Axis IMU)

ItsyBitsy Microcontroller

Force Sensor

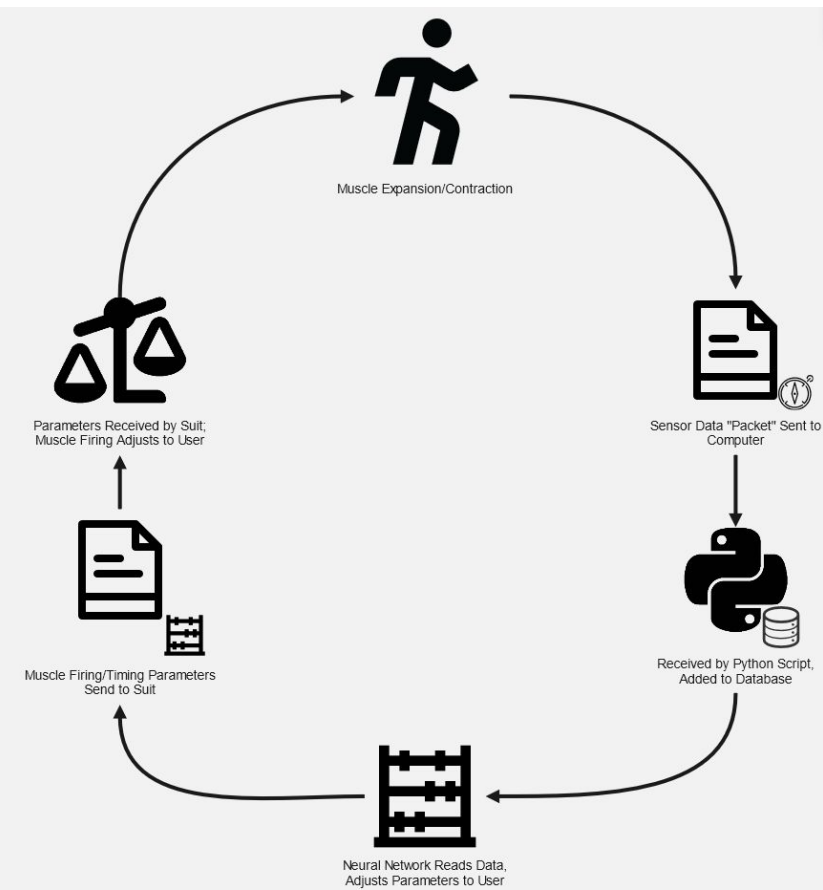

Load Cell Amplifier

Servo Motor

Arduino MEGA Microcontroller

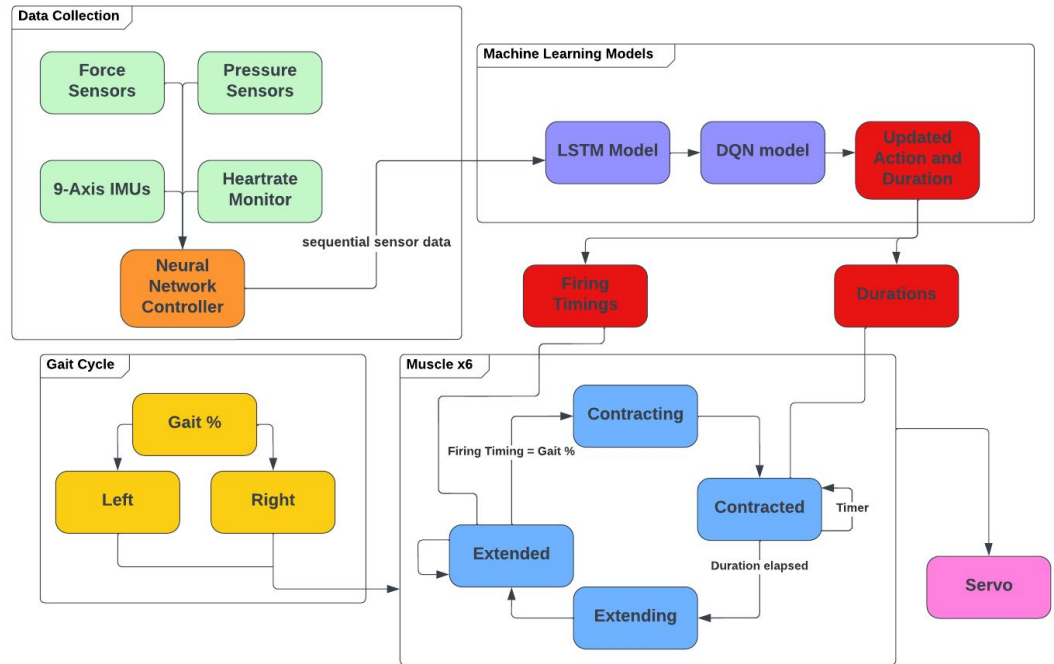

- Custom libraries built for inter-microcontroller networking
- “Suit-side” computation spread between ItsyBitsy and MEGA microcontrollers
- High-frequency sensor data collection for rapid adjustment
- **Result: Suit dynamically supports user, matches their movement speed and monitors their level of exertion**

Controls & Sensing

Controls & Sensing

- Adaptive Speed Control
- Hierarchical State Machine
- Servo/Valve Control

Controls & Sensing

- Pressurization Timing
- Adjustable Parameters
- Mechanical Motion vs. EMG data

Neural Network Structure

$x(1, 1), x(1, 2), \dots, x(1, m)$

$x(2, 1), x(2, 2), \dots, x(2, m)$

-
-
-

$x(n, 1), x(n, 2), \dots, x(n, m)$

Result

Effect of Exo-suit on average heart rate (BPM)		
Subject	Pace	Average heart rate changed in %
1	2.1mph - 3.6mph - 2.4 mph	-2.71%
2	2.2mph - 3.3 mph - 3.9mph	+1.8%
3	2.8mph - 3.4mph - 2.2mph	-7.78%
4	2.3 mph - 3.5mph - 2.7mph	-8.84%
